

Mona Relief Grande Aria

A Mona Relief Grande Aria irrigation unit has a vented irrigation inlet, it is easy to install and delivers water directly to the tree or shrub roots at a consistent level.

Features:

- Flip top grid for faster filling
- Cost effective
- Large water filling capacity
- Grid inlet limits blockages
- Allows water and air to access the irrigation pipe

| Model | Dia. of Irrigation Ring | Application |
|-------|-------------------------|---|
| MRG1 | 900mm | Large shrubs and trees up to approx. 20-25 girth |
| MRG5 | 1530mm | Trees with larger rootballs. 25cm girth and upwards, check rootball size and match irrigation accordingly |
| MRG8 | 2500mm | Trees with larger rootballs. 25cm girth and upwards, check rootball size and match irrigation accordingly |
| MRG8D | 2500mm (double inlet) | Aeration pipe, allows water and oxygen to reach the outer tree rooting area, improving soil health |

Application:

1. Place tree rootball in hole as with normal planting instructions

2. Measure the circumference of the rootball and cut the Mona Relief pipe to the required size. Connect both ends of the pipe to the Mona Relief T junction. The Mona Relief is most efficient when positioned within the top third of the rootball

3. Insert the Mona Relief feeding pipe with cap into the T junction

4. Back fill the area covering the Mona Relief ring and feeding pipe evenly, ensuring it remains level at all times

5. Leave space for the cap and feeding pipe to protrude from the ground, this prevents blockages of soil, stones and mulches

Specification:

It is recommended that when an urban tree is planted a tree irrigation system is put in place to ensure the tree receives the best start. By proactively installing a system that will irrigate at the rootball, the tree's roots instantly receive the much needed water to aid growth.

All Mona Relief inlets are available with varying irrigation pipe sizes, dependant on the rootball size.
