

Woodgrain Edge

Heavy Duty Garden Edging

Technical Data Sheet

Woodgrain Edge is a flexible garden edging system made from weather-resistant polyethylene. It provides durable border definition with a natural wood-effect finish.

Material & Packaging

Manufactured from polyethylene, Woodgrain Edge is supplied as a flexible 10m roll, 125mm in height. Each pack includes 10 brown polypropylene fixing pegs. The edging is UV protected, frost-resistant, and resistant to soil acidity. It is supplied in a 170mm x 270mm x 270mm carton weighing 3.5kg.

Applications

Woodgrain Edge is suitable for a wide range of landscape and edging tasks, including:

- **Defining edges** of lawns and flower beds in domestic gardens
- **Creating clean transitions** between turf, gravel paths, and planting areas
- **Providing long-lasting edge restraint** in public parks and golf courses
- **Supporting landscape schemes** where flexibility and durability are required
- **Preventing soil and grass migration** across garden zones
- **Pairs effectively with bamboo root barriers** to produce a neat border

Technical information

Material	Polyethylene (PE)
UV rating	1.5%
Service life	5 years
Available colors	Brown
Depth	125mm
Length	10m/roll
Thickness	3mm
Number of pegs	10
Length of pegs	240mm
Box size	H/W/D 170mm / 270mm / 270mm

Bamboo Containment

Woodgrain Edge can be used to support a firm, upright edge when installing FlexiRoot as a bamboo containment barrier.

By fixing the trimmed upper edge of the root barrier to Woodgrain Edge using Root Barrier Trade Adhesive, installers can achieve a neat and professional finish that maintains visual appeal and structural stability.

Installation Notes

Woodgrain Edge can be shaped by hand for curves or placed in straight lines. Best installed in shallow trenches, with fixing pegs inserted at intervals to ensure secure placement.

Root Barrier Finisher - the edging can be bonded to root barrier, such as FlexiRoot, to give a defined edge to the above-ground section of a vertical root barrier and assist in blocking roots (rhizome). The edging can also be used to hold a root barrier against a fence line, being screwed or bonded to the fence gravel board for a defined, neat finish.
