Security Fencing
+Gates

The logo for FST (Fencing Security Technology) is displayed in a large, bold, black, italicized sans-serif font. To the right of the letters 'ST' is a registered trademark symbol (®). The logo is centered over a background of ten vertical grey bars of varying heights, which are positioned behind the text.

FST[®]

Maximum Security System

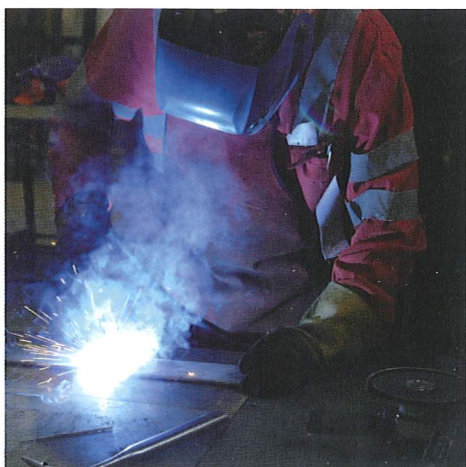

binns

Binns are the market leader in the manufacture and installation of High Security Fencing.

Our FST[®] anti-climb system is currently the most secure available and has been installed in HM Prisons, Secure Hospitals, Young Offender Institutions and Immigration Centres throughout the UK and worldwide.

Binns FST[®] system is designed, manufactured and installed for maximum security.

Binns FST (Flexible Security Topping) is currently the most secure topping system available. It is the work of the experienced high security design team at Binns, one of the UK's premier high security specialists, and the leading installer of security fencing for Her Majesty's prisons for over 30 years.

Binns FST uses top quality, specially selected materials, and is manufactured by Binns to the very highest standards for long life and long-term reliability.

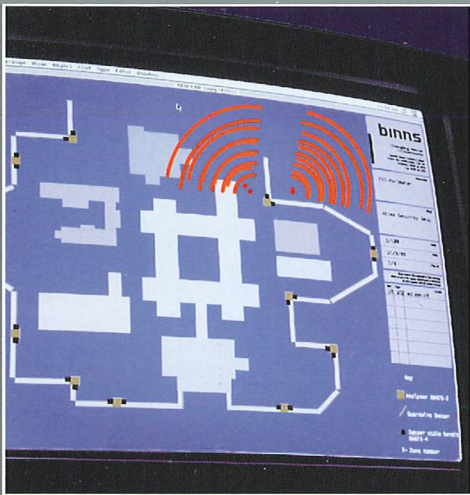

The result of our programme of continuous innovation, Binns FST is a registered design, fully tested and approved by Her Majesty's Government for use in high security prisons in the United Kingdom. Binns FST uses top quality, specially selected materials, and is manufactured by Binns to the very highest standards for long life and long-term reliability. All materials are galvanised but stainless steel razor wire is recommended to give maximum service life.

At the heart of Binns FST is a steel mesh fixed to a flexible steel bracket that is designed to move when people attempt to climb, upsetting balance and hand holds. The structure is designed to withstand a man's weight, so the FST system does not collapse when climbed. Specially sourced spring steel and custom-designed fitments ensure Binns FST is an investment for the long term.

Installation is carried out by Binns Fencing, who have trained their operatives to implement the very careful procedures required for high security systems.

Advanced alarm system from Geoquip—the Binns FST/Geoquip system fully satisfies an original Home Office specification for fence detection. It can be fixed to any version of FST and can interface to any security management system, building management system or intruder alarm panel using standard relay contacts.

The electronic analysers—process the signal and only alarm when a pre-programmed event occurs.

Patented sensor cable—offers wider frequency detection capabilities and linear characteristics leaving no weak spots.

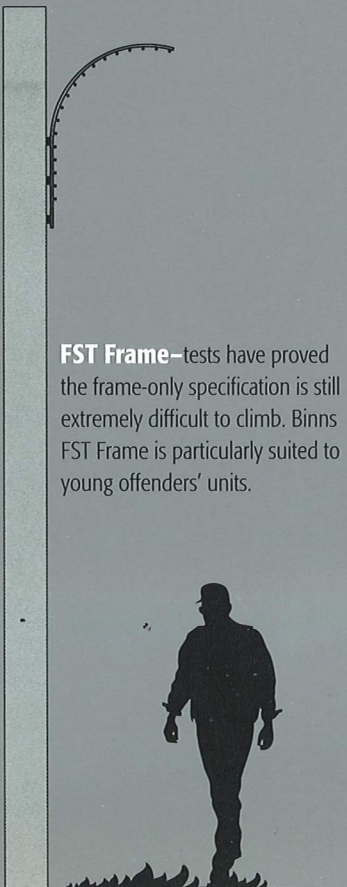

Sensor cable output—is continuously monitored on an individual zone basis.

Two-channel detection—can be configured to detect cut and climb.

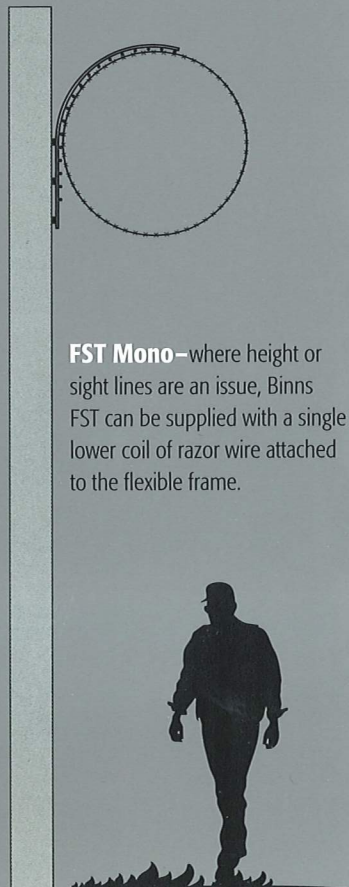

Monitors individual zones—continuous monitoring of specific high security areas.

Advanced annunciator system—detects tamper conditions and demands a direct response to acknowledge and reset the alarm.

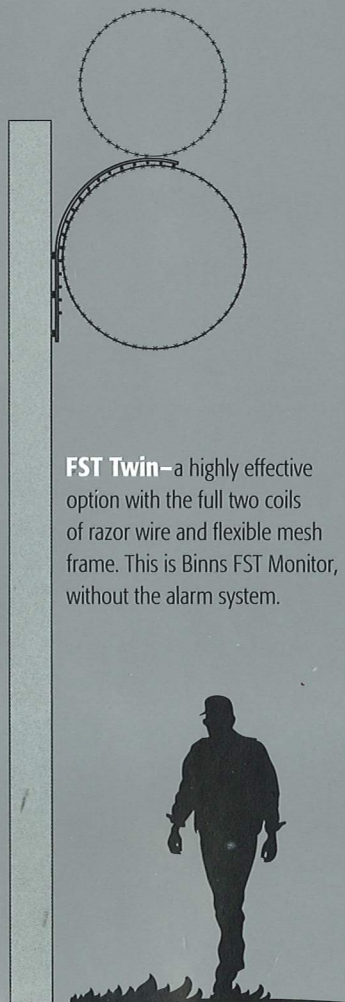

Direct interface with CCTV systems—cameras operate as functional or static units.

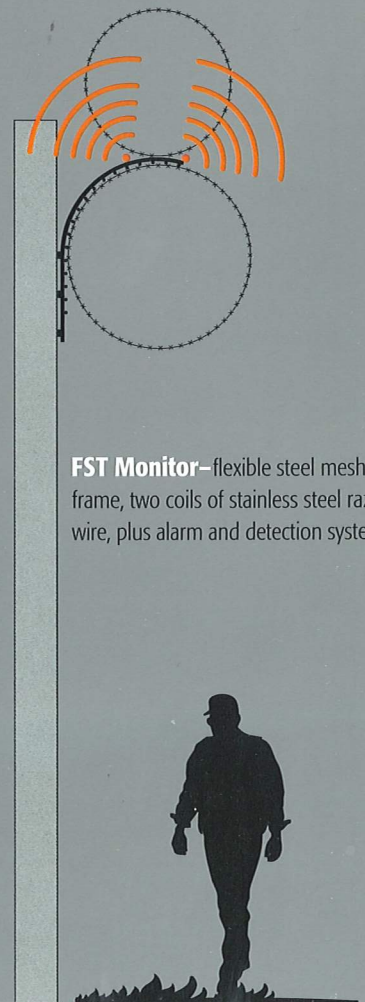

FST Frame—tests have proved the frame-only specification is still extremely difficult to climb. Binns FST Frame is particularly suited to young offenders' units.

FST Mono—where height or sight lines are an issue, Binns FST can be supplied with a single lower coil of razor wire attached to the flexible frame.

FST Twin—a highly effective option with the full two coils of razor wire and flexible mesh frame. This is Binns FST Monitor, without the alarm system.

FST Monitor—flexible steel mesh frame, two coils of stainless steel razor wire, plus alarm and detection system.
